# 1. Preparing environment

In order to build multi-platform applications using .NET on macOS, the first steps are for installing in our MAC machine the required tools.

**We need to install .NET Core SDK from Microsoft and to allow us to develop easier, we will install an advance editor with a lot of features, Visual Studio Code from Microsoft.**

Both installations are very easy and the detailed description can be found by these two links:

- [Install .NET Core SDK for macOS.](#)

- [Install VS Code for macOS.](#)

The image shows the Visual Studio Code website with the headline "Code editing. Redefined." and a download table. To the right, an inset shows the VS Code interface with the Extensions view open, displaying a list of popular extensions like C#, Python, and ESLint.

		Stable	Insiders
<b>macOS</b>	Package	↓	↓
<b>Windows x64</b>	User Installer	↓	↓
<b>Linux x64</b>	.deb	↓	↓
	.rpm	↓	↓

[Other downloads](#)

Once installed VS Code, you need to install a C# extension to facilitate us to code and debugging:

Install [C# extension](#).

**Important!** The information is valid for versions up to 2024.X

At the time of this writing, .NET Core has a problem with supporting the GdiPlus library on macOS. There is a solution that will help you to run any .NET libraries using GdiPlus.

## Problem:

You got the whole thing up and running in debug, but when you went for your dotnet run, you got the following crash:

```
The type initializer for 'System.Drawing.GDIPlus' threw an exception. -> System.DllNotFoundException: Unable to load DLL 'gdiplus': The specified module or one of its dependencies could not be found.
```

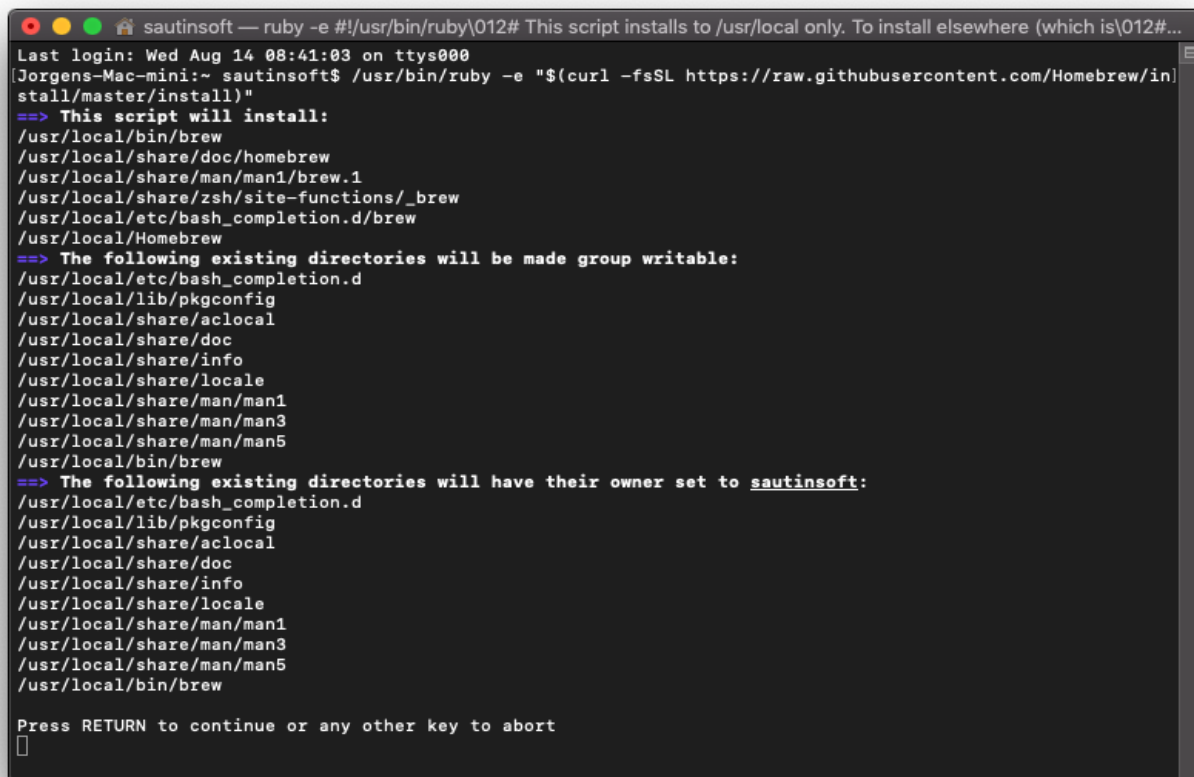

## Solution:

First of all, you need to install "[Homebrew](#)" - The missing package manager for macOS.

*Paste that in a macOS Terminal prompt:*

```
$ /usr/bin/ruby -e "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/install/master/install)"
```

The script explains what it will do and then pauses before it does it.

```
sautinsoft — ruby -e #!/usr/bin/ruby012# This script installs to /usr/local only. To install elsewhere (which is\012#...
Last login: Wed Aug 14 08:41:03 on ttys000
Jorgens-Mac-mini:~ sautinsoft$ /usr/bin/ruby -e "$(curl -fsSL https://raw.githubusercontent.com/Homebrew/in
stall/master/install)"
==> This script will install:
/usr/local/bin/brew
/usr/local/share/doc/homebrew
/usr/local/share/man/man1/brew.1
/usr/local/share/zsh/site-functions/_brew
/usr/local/etc/bash_completion.d/brew
/usr/local/Homebrew
==> The following existing directories will be made group writable:
/usr/local/etc/bash_completion.d
/usr/local/lib/pkgconfig
/usr/local/share/aclocal
/usr/local/share/doc
/usr/local/share/info
/usr/local/share/locale
/usr/local/share/man/man1
/usr/local/share/man/man3
/usr/local/share/man/man5
/usr/local/bin/brew
==> The following existing directories will have their owner set to sautinsoft:
/usr/local/etc/bash_completion.d
/usr/local/lib/pkgconfig
/usr/local/share/aclocal
/usr/local/share/doc
/usr/local/share/info
/usr/local/share/locale
/usr/local/share/man/man1
/usr/local/share/man/man3
/usr/local/share/man/man5
/usr/local/bin/brew
Press RETURN to continue or any other key to abort
```

[support@sautinsoft.com](mailto:support@sautinsoft.com)

Homebrew installs [the stuff you need](#) that Apple (or your Linux system) didn't.

*Paste that in a macOS Terminal prompt:*

```
$ brew install wget
```

Homebrew installs packages to their own directory and then symlinks their files into `/usr/local`

A screenshot of a macOS Terminal window. The title bar shows a home icon, the name 'sautinsoft', and the prompt '-bash — 80x5'. The terminal text shows 'Last login: Wed Aug 14 10:08:52 on ttys000' followed by the prompt 'Jorgens-Mac-mini:~ sautinsoft\$' and the command 'brew install wget' being entered at the end of the line.

```
sautinsoft — -bash — 80x5
Last login: Wed Aug 14 10:08:52 on ttys000
Jorgens-Mac-mini:~ sautinsoft$ brew install wget
```

Homebrew won't install files outside its prefix and you can place a Homebrew installation wherever you like. Homebrew complements macOS (or your Linux system). Install your RubyGems with `gem` and their dependencies with `brew`.

Now, we need to install [mono-libgdiplus](#). GdiPlus – compatible API on non-Windows operating systems.

*Paste that in a macOS Terminal prompt:*

```
$ brew install mono-libgdiplus
```

A screenshot of a macOS Terminal window. The title bar shows a home icon, the name 'sautinsoft', and the prompt '-bash — 80x5'. The terminal text shows 'Last login: Wed Aug 14 10:09:10 on ttys000' followed by the prompt 'Jorgens-Mac-mini:~ sautinsoft\$' and the command 'brew install mono-libgdiplus' being entered at the end of the line.

```
sautinsoft — -bash — 80x5
Last login: Wed Aug 14 10:09:10 on ttys000
Jorgens-Mac-mini:~ sautinsoft$ brew install mono-libgdiplus
```

Congratulations, you have installed all the dependencies needed to run .NET components.

## 2. Dependencies and samples

Create a simple project by Visual Code or an another Environment for C# or VB.NET. To get started with our product, you need to include the following NuGet packages in your project file (and don't forget to add our library to your project's references):

```
<PackageReference Include="System.IO.Packaging" Version="4.5.0" />
<PackageReference Include="System.Text.Encoding.CodePages" Version="4.5.0" />
<PackageReference Include="SkiaSharp" Version="2.88.7" />
<PackageReference Include="Svg.Skia" Version="1.0.0.18" />
<PackageReference Include="SkiaSharp.NativeAssets.macOS" Version="2.88.7" />
```

Great! Now you can fully harness our product and bring all your ideas to life.

Need inspiration or guidance? Check out a lot of code samples on our website:
