# 1. Preparing environment

In order to build multi-platform applications using .NET on Linux, the first steps are for installing in our Linux machine the required tools.

We need to install .NET SDK from Microsoft and to allow us to develop easier, we will install an advance editor with a lot of features, Visual Studio Code from Microsoft.

Both installations are very easy and the detailed description can be found by these two links:

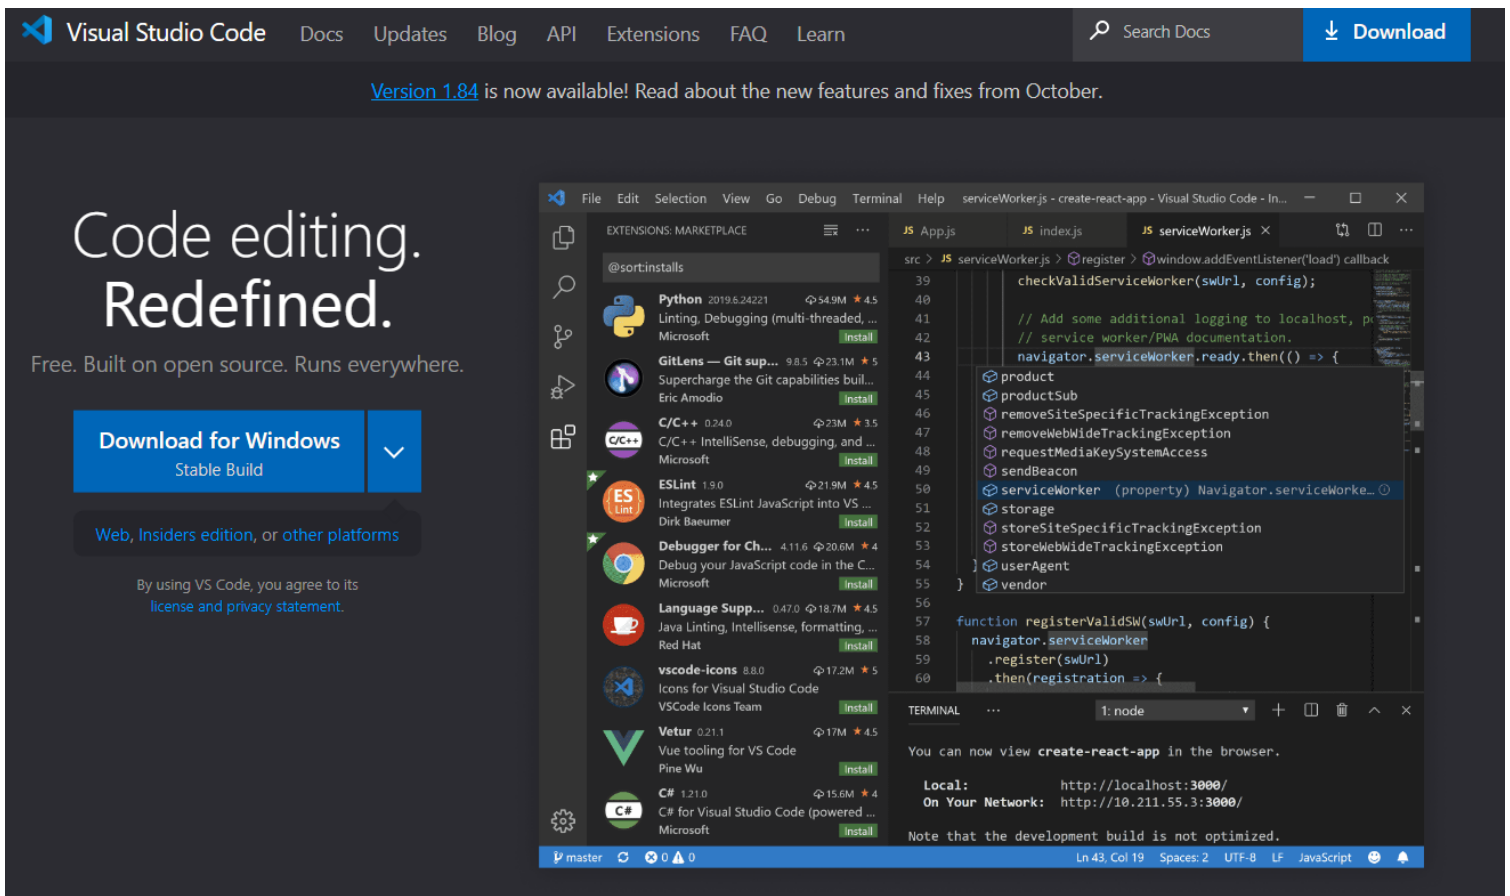

[Install .NET SDK for Linux.](#)

[Install VS Code for Linux.](#)

Once installed VS Code, you need to install a C# extension to facilitate us to code and debugging:

Install [C# extension](#).

## 1.1. Check the installed Fonts availability

Check that the directory with fonts `"/usr/share/fonts/truetype"` is exist. Also check that it contains `*.ttf` files.

If you don't see this folder, you may install "Microsoft TrueType core fonts" using terminal and command:

```
$ sudo apt install ttf-mscorefonts-installer
```

```
linuxconfig@linuxconfig-org: ~  
All done, no errors.  
Extracting cabinet: /var/lib/update-notifier/package-data-downloads/partial/verdan32.exe  
  extracting fontinst.exe  
  extracting fontinst.inf  
  extracting Verdanab.TTF  
  extracting Verdanai.TTF  
  extracting Verdanz.TTF  
  extracting Verdana.TTF  
  
All done, no errors.  
Extracting cabinet: /var/lib/update-notifier/package-data-downloads/partial/webdin32.exe  
  extracting fontinst.exe  
  extracting Webdings.TTF  
  extracting fontinst.inf  
  extracting Licen.TXT  
  
All done, no errors.  
All fonts downloaded and installed.  
Processing triggers for man-db (2.9.0-2) ...  
Processing triggers for fontconfig (2.13.1-2ubuntu2) ...  
linuxconfig@linuxconfig-org:~$
```

Read more about [TrueType Fonts and "How to install Microsoft fonts, How to update fonts cache files, How to confirm new fonts installation"](#) .

In next paragraphs we will explain in detail how to create simple console application. All of them are based on this VS Code guide:

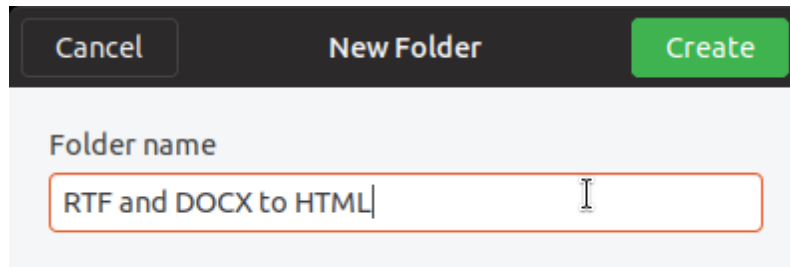

[Get Started with C# and Visual Studio Code](#)

Not only is possible to create .NET applications that will run on Linux using Linux as a developing platform. It is also possible to create it using a Windows machine and any modern Visual Studio version, as Microsoft Visual Studio Community 2022.

## 2. Creating “Convert RTF/DOCX to HTML” app

Create a new folder in your Linux machine with the name **RTF and DOCX to HTML**.

For example, let’s create the folder “**RTF and DOCX to HTML**” on Desktop (Right click-> New Folder):

Open VS Code and click in the menu **File->Open Folder**. From the dialog, open the folder you’ve created previously:

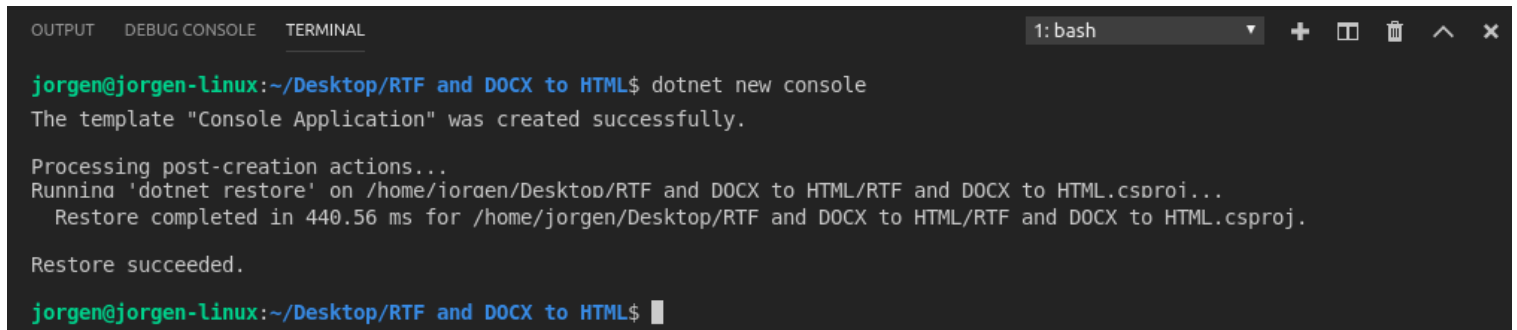

Now, open the integrated console – the Terminal: follow to the menu **Terminal -> New Terminal** (or press Ctrl+Shift+’):

Create a new console application, using **dotnet** command.

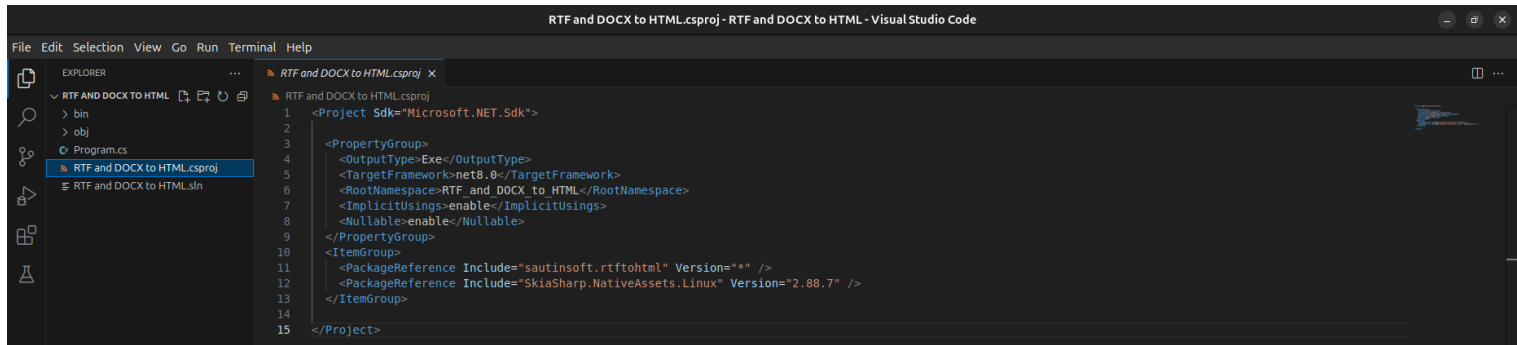

Type this command in the Terminal console: **dotnet new console**

A terminal window with tabs for OUTPUT, DEBUG CONSOLE, and TERMINAL. The terminal shows the command 'dotnet new console' being executed. The output indicates that the 'Console Application' template was created successfully. It then shows post-creation actions, including running 'dotnet restore' on the project file, which completed in 440.56 ms. Finally, it states 'Restore succeeded.' and shows the prompt 'jorgen@jorgen-linux:~/Desktop/RTF and DOCX to HTML\$'.

Now we are going to modify this simple application into an application that will convert rtf and docx files into HTML format.

First of all, we need to add the package reference to the **sautinsoft.rtftohtml** assembly using Nuget.

In order to do it, follow to the **Explorer** and open project file **"RTF and DOCX to HTML.csproj"** :

A screenshot of Visual Studio Code. The Explorer sidebar on the left shows a project structure with folders 'bin', 'obj', and 'Program.cs', and a file 'RTF and DOCX to HTML.csproj'. The main editor area shows the content of 'RTF and DOCX to HTML.csproj'. The XML content includes project SDK, output type, target framework, root namespace, and two package references: 'sautinsoft.rtftohtml' and 'SkiaSharp.NativeAssets.Linux'.

Add these lines into the file **"RTF and DOCX to HTML.csproj"**:

```
<ItemGroup>

    <PackageReference Include="sautinsoft.rtftohtml" Version="*" />
    <PackageReference Include="SkiaSharp.NativeAssets.Linux" Version="2.88.7" />

</ItemGroup>
```

The first reference installs the latest version **sautinsoft.rtftohtml** package from Nuget.  
The second reference installs the **SkiaSharp.NativeAssets.Linux** package, which adds 2D graphics to .Net applications for Linux.

At once as we've added the package references, we have to save the "**RTF and DOCX to HTML.csproj**" and restore the added packages.

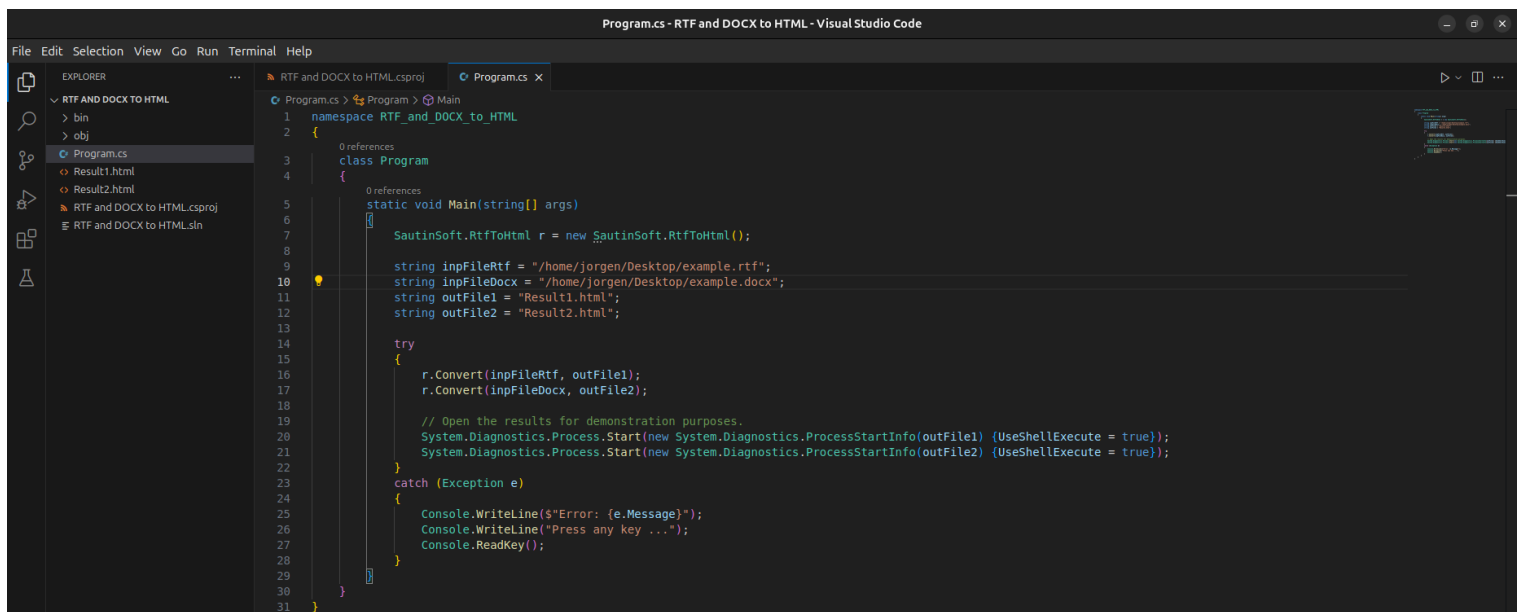

Follow to the **Terminal** and type the command: **dotnet restore**

```
OUTPUT  DEBUG CONSOLE  TERMINAL
jorgen@jorgen-linux:~/Desktop/RTF and DOCX to HTML$ dotnet restore
Restore completed in 157.2 ms for /home/jorgen/Desktop/RTF and DOCX to HTML/RTF and DOCX to HTML.csproj.
jorgen@jorgen-linux:~/Desktop/RTF and DOCX to HTML$
```

Good, now our application has all the references and we can write the code to convert DOCX and RTF documents into HTML format.

Follow to the **Explorer**, open the **Program.cs**, remove all the code and type the new:

```
Program.cs - RTF and DOCX to HTML - Visual Studio Code
File Edit Selection View Go Run Terminal Help
EXPLORER
RTF AND DOCX TO HTML
> bin
> obj
Program.cs
Result1.html
Result2.html
RTF and DOCX to HTML.csproj
RTF and DOCX to HTML.sln
Program.cs
1 namespace RTF_and_DOCX_to_HTML
2 {
3     0 references
4     class Program
5     {
6         0 references
7         static void Main(string[] args)
8         {
9             SautinSoft.RtfToHtml r = new SautinSoft.RtfToHtml();
10
11             string inFileRtf = "/home/jorgen/Desktop/example.rtf";
12             string inFileDocx = "/home/jorgen/Desktop/example.docx";
13             string outFile1 = "Result1.html";
14             string outFile2 = "Result2.html";
15
16             try
17             {
18                 r.Convert(inFileRtf, outFile1);
19                 r.Convert(inFileDocx, outFile2);
20
21                 // Open the results for demonstration purposes.
22                 System.Diagnostics.Process.Start(new System.Diagnostics.ProcessStartInfo(outFile1) {UseShellExecute = true});
23                 System.Diagnostics.Process.Start(new System.Diagnostics.ProcessStartInfo(outFile2) {UseShellExecute = true});
24             }
25             catch (Exception e)
26             {
27                 Console.WriteLine($"Error: {e.Message}");
28                 Console.WriteLine("Press any key ...");
29                 Console.ReadKey();
30             }
31         }
32     }
33 }
```

## The code:

```
namespace RTF_and_DOCX_to_HTML
{
    class Program
    {
        static void Main(string[] args)
        {
            SautinSoft.RtfToHtml r = new SautinSoft.RtfToHtml();

            string inFileRtf = "/home/jorgen/Desktop/example.rtf";
            string inFileDocx = "/home/jorgen/Desktop/example.docx";
            string outFile1 = "Result1.html";
            string outFile2 = "Result2.html";

            try
            {
                r.Convert(inFileRtf, outFile1);
                r.Convert(inFileDocx, outFile2);
```

# Welcome to SautinSoft!

## This is «RTF to HTML .Net» sample

### Subtitle

This rich text document content serves as basis for trying out various rich text formatting.

### Header 1

**Bold** *italic* underlined ~~strikethrough~~ Nsubscript Nsuperscript

### Sub header 1.1
